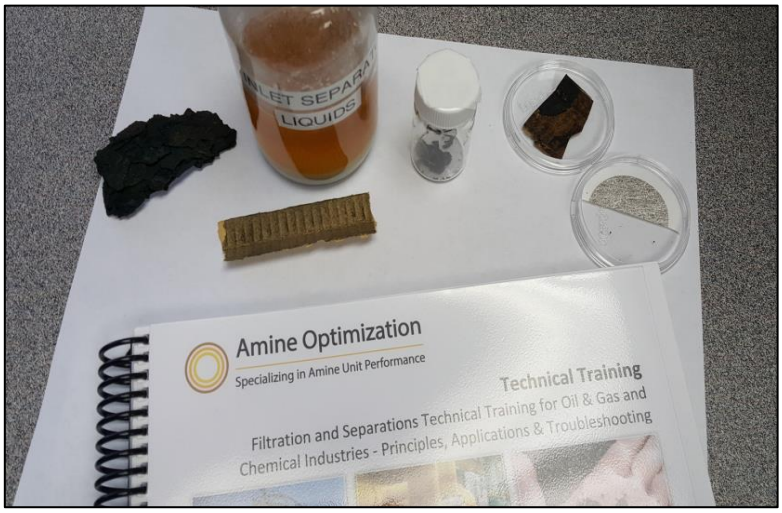
Amine Optimization

Specializing in Amine Unit Performance

All products and services are matched to individual amine units with the objective of improving process performance and plant reliability.

Technical Training Seminars

AOC offers a series of on-site and web-based technical training seminars on a variety of topics. Every course is tailored toward specific company needs utilizing case studies taken from current and previous projects.



Contamination can contribute to over 50% of a plant's loss of efficiency and weighs heavily in the training.

Training objectives:

- Understanding modes of failure
- Understand equipment designs
- Troubleshoot performance problems
- Review the science behind separation, filtration and coalescing
- Review its application in gas processing and refining industries
- Vessel Reconfigurations
- Discussion of real cases

Areas Covered:

General amine process unit operation, equipment details, filtration and coalescing, inlet separation, activated carbon, process additives, foaming, fouling, corrosion, failure modes and troubleshooting

Attendees come away with a better understanding of their plant processes and a better idea of how and where to troubleshoot issues in the field. The gained knowledge leads to faster recovery times from plant upsets. Included in the training is a workbook of the presentation slides.
